Lead Software Engineer with 5+ years building high-scale backend systems, distributed systems, search infrastructure, and production AI. Reduced search latency 25×, scaled messaging from 500 to 100k recipients, and cut infrastructure costs 50%+.

EXPERIENCE

SenseHQ, Bangalore, India

Jun 2021 – Present

Lead Software Engineer

Apr 2025 – Present

- Reduced **p95 search latency from 2.5s to 100ms** by leading the end-to-end redesign and rollout of a messaging typeahead on OpenSearch, including migration of multiple entity datasets to a new cluster.
- Improved **customer-support SLA from 50% to 90%+** by shipping Jiraffe, a production RAG system using OpenSearch embeddings over internal codebases and historical tickets; cut average ticket resolution from 4 days to hours.
- Cut **infrastructure costs by 50%+** across RDS and OpenSearch through caching, query optimisation, capacity tuning, and index redesign; reduced RDS CPU from 90% to under 60% and OpenSearch shards from 32 to 2.
- Drove shared messaging architecture across three product teams, coordinating service dependencies, data migrations, and rollouts; led architecture reviews and mentored backend engineers.

Senior Software Engineer

Jul 2022 – Apr 2025

- Scaled bulk messaging **from 500 to 100k recipients per send** via a Kafka pipeline with distributed workers and retries; cut p99 API latency from 13s to 1.5s and delivered 100k messages in 30 seconds.
- Resolved a mobile session leak in a Redis-backed session flow, eliminating recurring customer logouts and cutting session storage **from 20GB to under 4GB**.
- Instrumented 80% of messaging workflows with StatsD and Datadog, standardising SLA tracking and shortening incident diagnosis.
- Replaced Retool with a self-hosted Lowcoder platform, leading the POC, deployment on internal infrastructure, and migration of production workflows; reduced annual software costs by **\$50K+**.

Software Engineer

Jun 2021 – Jul 2022

- Automated internal workflows and data migrations, reducing manual operations from 4 days to a few hours.

ExamPlus

Jul 2020 – Dec 2020

Software Engineer (Part-Time)

Remote

- Built backend systems for a JEE and NEET online examination platform that reached INR 5M in monthly revenue within three months.

SELECTED PRODUCTS

Blindspot – Claim-by-Claim Reel Fact-Checking

2026

Next.js, Python, SQLite, FFmpeg, Whisper, LLMs

blindspot.buzz

- Built an end-to-end AI fact-checking pipeline for Instagram Reels spanning transcription, claim extraction, evidence retrieval, claim-level evaluation, and cited reporting.
- Reduced end-to-end inference and processing cost to **\$0.0215 per report** through stage-level budget controls and idempotent processing.

ScamDB – Community Fraud Awareness Platform

May 2026 – Present

Next.js, Python, Supabase, PostgreSQL, Redis

scamdb.in | [GitHub](https://github.com)

- Built a fraud-lookup platform for Indian phone numbers and UPI IDs with a 6-hour ingestion pipeline across Reddit, X, and government advisories, extracting identifiers via OCR and LLM enrichment.
- Built deduplication, moderation, and entity-resolution workflows generating searchable phone and UPI entity pages with provenance controls.

SKILLS

Languages: Python, Java, TypeScript/JavaScript, Go, SQL, C++

Backend: Flask, Django, Node.js, React, REST APIs, Microservices, Event-Driven Architecture, Payments, Authentication, Security

Systems & Data: Kafka, PostgreSQL, MySQL, MongoDB, Redis, Elasticsearch/OpenSearch, pgvector

Cloud & DevOps: AWS (ECS, EC2, S3, SQS, Lambda, DynamoDB), Docker, Kubernetes, Terraform, CI/CD

AI & Observability: Machine Learning (ML), RAG, LLM Systems, Vector Search, MCP, Datadog, Grafana

EDUCATION

Indian Institute of Science Education and Research (IISER), Bhopal

2017–2021

B.S. in Computer Science and Engineering
